Design Writeup

My Details Page - With New Features

For the details page, I revised my design of the frosting button and I added a red notification to visually indicate the amount of items in the cart. Furthermore, I added new images that change based on the selection of frosting.

I changed my frosting selection button to have a “frosting” icon and different cream colors to visually communicate that you can choose different types of frosting to add to the cart. Before, I only had color swatches in the form of circles, but I revised it to the design of a frosting icon to better communicate the frosting selection.

I added a notification with a number so you can see how many items you have added to the cart. This provides feedback for the user to know that the system is working and the bright red notification button will guide the user to click on the cart, and checkout the products.

I added new images with corresponding frosting choices that will change based on the selection of frosting. I did this to visually communicate what frosting selection the user has chosen.

My Cart Page - New Page with Adjustments

For the Cart page, I adjusted my design to left align the text/buttons. I also took out the “promo code” section to keep things simple and removed the circle frame on the images of the items inside the cart.

To keep the looks consistent with the other pages, and to make sure I am reusing the same design pattern, I left aligned the text and buttons. I also took off the circle frame of the item image because the rest of my images were consistently square. I mainly made these adjustments to follow my design pattern so I can reuse the different things I already coded.
